# 8 bit processor

a simple 8 bit processor with a text display

# The Bus

example for RP2

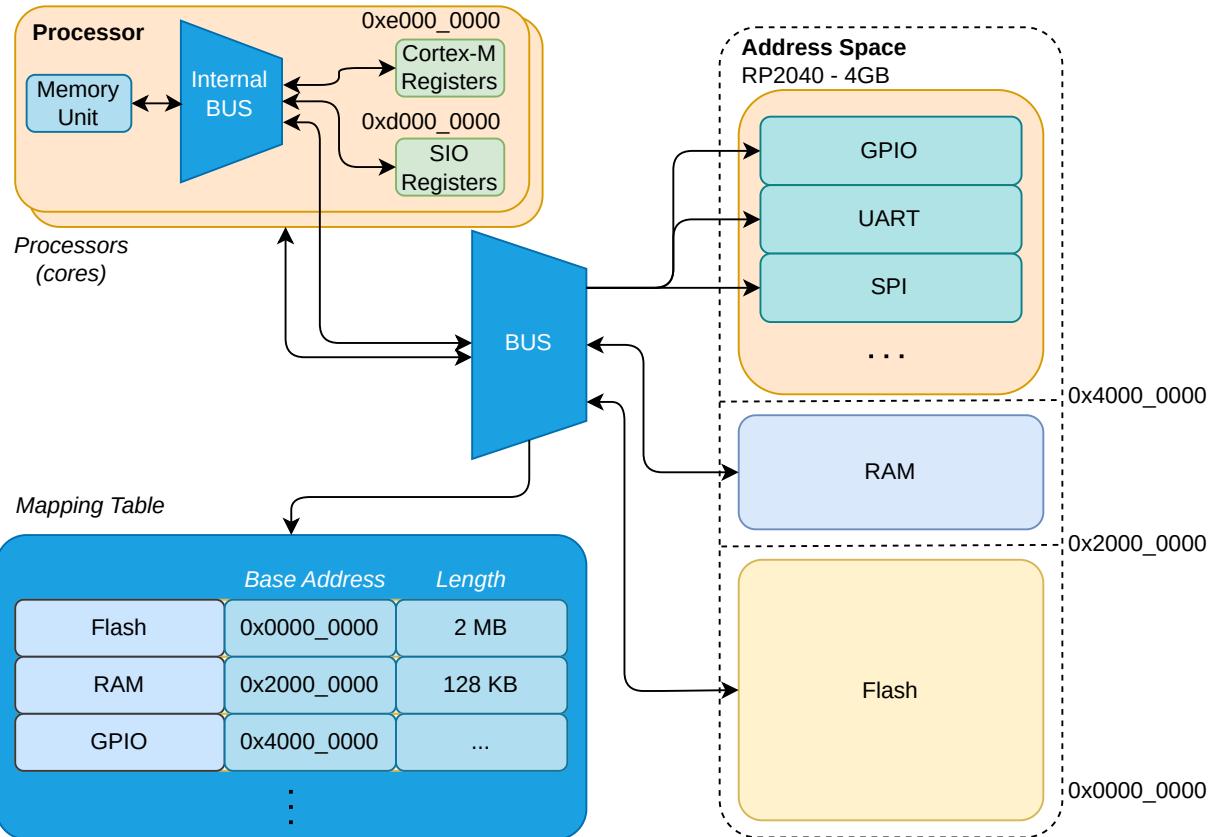

1. **Memory Controller** asks for data transfer

2. **Internal Bus Routes** the request

- to the *External Bus or*
- to the *Internal Peripherals*

3. **External Bus Routes** the request based on the *Address Mapping Table*

1. to **RAM**
2. to **Flash**
3. to an **External Peripheral**

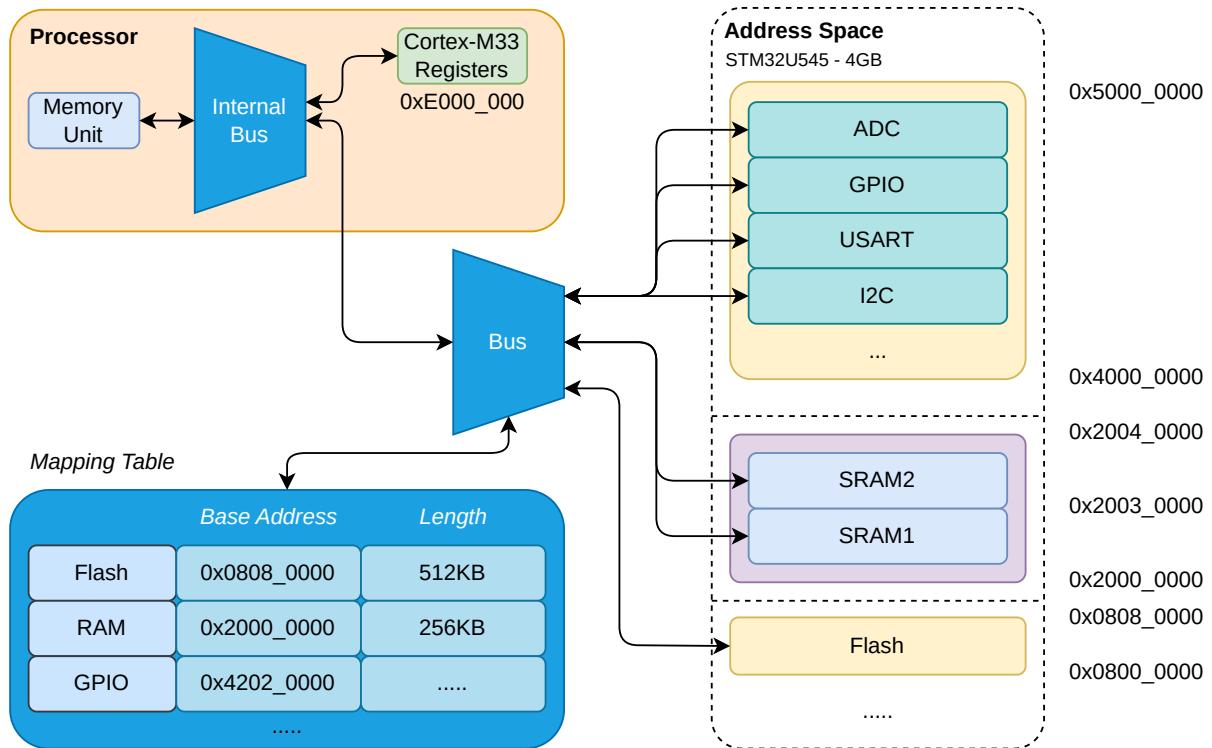

# The Bus

example for STM32U545RE

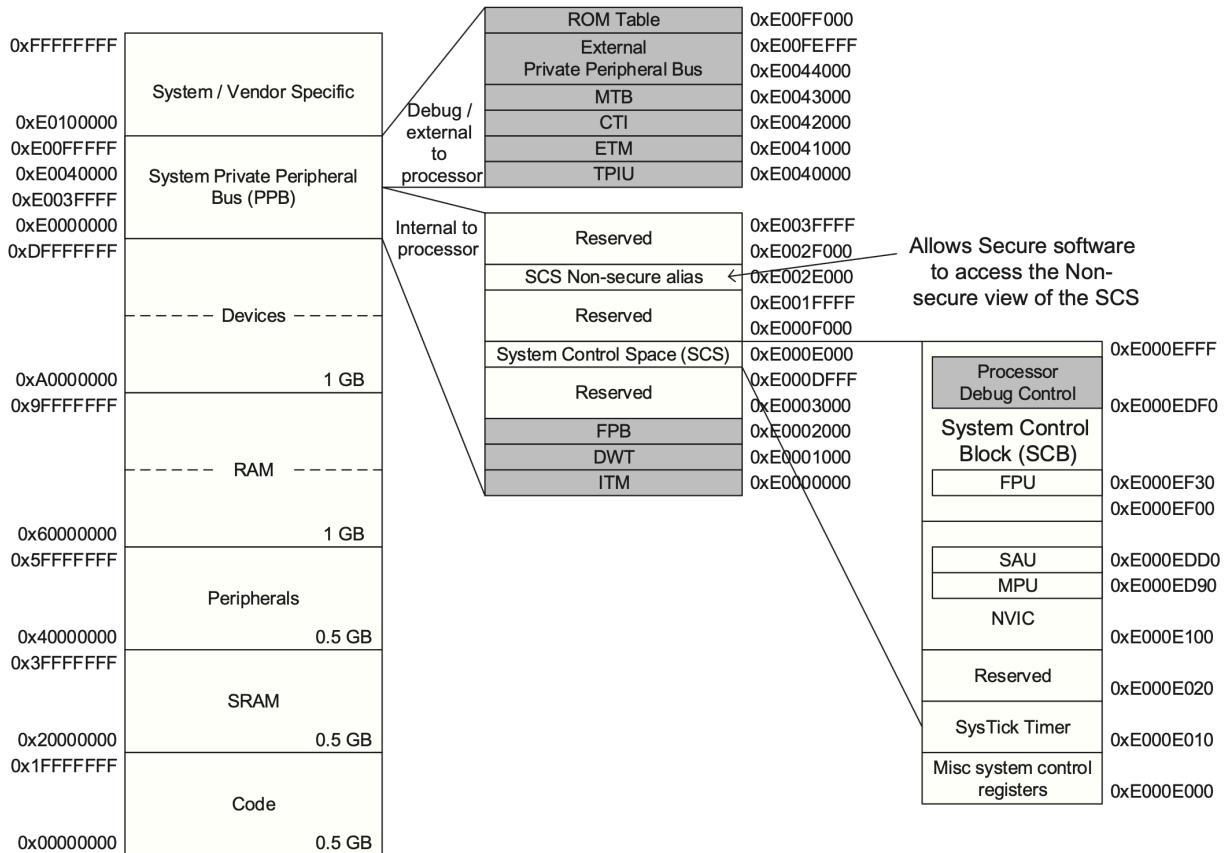

1. **Memory Controller** asks for data transfer
2. **Internal Bus Routes** the request
  - to the *External Bus or*
  - to the *Internal Peripherals*
3. **External Bus Routes** the request based on the *Address Mapping Table*

1. to RAM
2. to Flash
3. to an External Peripheral

# Cortex-M33 Memory Layout

# System Control Registers

Cortex-M0+[<sup>1</sup>] SCR Peripheral @0xe000\_0000

Compute the actual address

$$e000\_0000_{(16)} + register_{offset}$$

Register Examples:

- SYST\_CSR: **0xe000\_e010** ( $0xe000\_0000 + 0xe010$ )
- CPUID: **0xe000\_ed00** ( $0xe000\_0000 + 0xed00$ )

```
const SYS_CTRL_ADDR: usize = 0xe000_0000;
const CPUID_OFFSET: usize = 0xed00;

let cpuid_reg = (SYS_CTRL_ADDR+CPUID_OFFSET) as *const u32;
let cpuid_value = unsafe { *cpuid_reg };
// or
let cpuid_value = unsafe { cpuid_reg.read() };
```

⚠ Compilers optimize code and processors use cache!

0xed14	<a href="#">CCR</a>	Configuration and Control Register

1. Cortex-M33 has some additional registers ↪

# Compiler Optimization

compilers optimize code

Write bytes to the `UART` (serial port) data register

```
1 // we use mut as we need to write to it
2 const UART_TX: *mut u8 = 0x4003_4000 as *mut u8;
3 // b"" means ASCII string (Rust uses UTF-8 strings by default)
4 for character in b"Hello, World".iter() {
5     // character is &char, so we use *character to get the value
6     unsafe { UART_TX.write(*character); }
7 }
```

1. The compiler does not know that `UART_TX` is a register and uses it as a memory address.
2. Writing several values to the same memory address will result in having the last value stored at that address.
3. The compiler optimizes the code write the value

```
1 const UART_TX: *mut u8 = 0x4003_4000;
2 unsafe { UART_TX.write(b'd'); }
```

# No Compiler Optimization

CPUID: 0xe000\_ed00 ( $0xe000_0000 + 0xed00$ )

```
use core::ptr::read_volatile;

const SYS_CTRL_ADDR: usize = 0xe000_0000;
const CPUID_OFST: usize = 0xed00;

let cpuid_reg = (SYS_CTRL_ADDR + CPUID_OFST) as *const u32;
unsafe {
    // avoid compiler optimization
    read_volatile(cpuid_reg)
}
```

read\_volatile,  
write\_volatile

**no compiler  
optimization**

read, write, \*p

**use compiler  
optimization**

Offset	Name	Info

0xed08	VTOR	Vector Table Offset Register
0xed0c	AIRCR	Application Interrupt and Reset Control Register
0xed10	SCR	System Control Register
0xed14	CCR	Configuration and Control Register

# No Compiler Optimization

Write bytes to the `UART` (serial port) data register

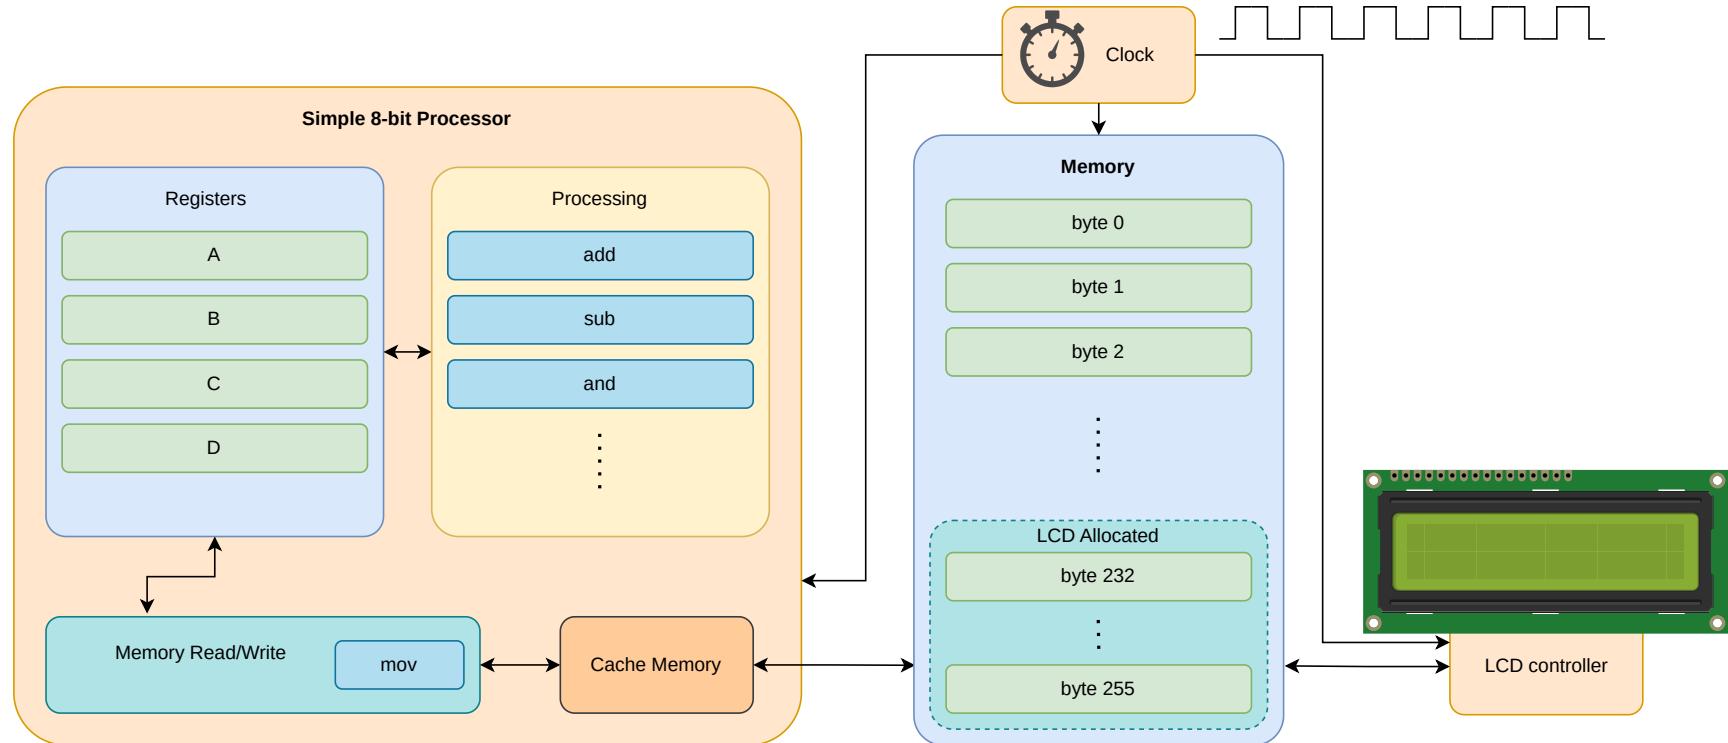

```
1 use core::ptr::write_volatile;
2
3 // we use mut as we need to write to it
4 const UART_TX: *mut u8 = 0x4003_4000 as *mut u8;
5 // b"" means ASCII string (Rust uses UTF-8 strings by default)
6 for character in b"Hello, World".iter() {
7     // character is &char, so we use *character to get the value
8     unsafe { write_volatile(UART_TX, *character); }
9 }
```

The compiler **knows** that `UART_TX` **must be written** every time.

# 8 bit processor

with cache

# No Cache or Flush Cache

- Cache types:
  - *write-through* - data is written to the cache and to the main memory (bus)
  - *write-back* - data is written to the cache and later to the main memory (bus)
- few Cortex-M MCUs have cache
- the Memory Mapped I/O region is set as *nocache*
- for chips that use cache
  - *nocache* regions have to be set manually (if MCU knows)
  - or, the cache has to be flushed before a `volatile_read` and after a `volatile_write`
  - beware DMA controllers that can't see the cache contents

# Read the CPUID

## About the MCU

```
use core::ptr::read_volatile;

const SYS_CTRL_ADDR: usize = 0xe000_0000;
const CPUID_OFST: usize = 0xed00;

let cpuid_reg = (SYS_CTRL_ADDR+CPUID_OFST) as *const u32;
let cpuid_value = unsafe {
    read_volatile(cpuid_reg)
};

// shift right 20 bits and keep only the last 4 bits
let variant = (cpuid_value >> 20) & 0b1111;

// shift right 16 bits and keep only the last 4 bits
let architecture = (cpuid_value >> 16) & 0b1111;

// shift right 4 bits and keep only the last 12 bits
let part_no = (cpuid_value >> 4) & 0b1111_1111_1111;

// shift right 0 bits and keep only the last 4 bits
let revision = (cpuid_value >> 0) & 0b1111;
```

# CPUID Register

# AIRCR

Application Interrupt and Reset Control Register

```
use core::ptr::read_volatile;
use core::ptr::write_volatile;

const SYS_CTRL_ADDR: usize = 0xe000_0000;
const AIRCR_OFST: usize = 0xed0c;

const VECTKEY_POS: u32 = 16;
const SYSRESETREQ_POS: u32 = 2;

let aircr_register = (SYS_CTRL + AIRCR) as *mut u32;
let mut aircr_value = unsafe {
    read_volatile(aircr_register)
};

aircr_value = aircr_value & !(0xffff << VECTKEY_POS);
aircr_value = aircr_value | (0x05fa << VECTKEY_POS);
aircr_value = aircr_value | (1 << SYSRESETREQ_POS);

unsafe {
    write_volatile(aircr_register, aircr_value);
}
```

# AIRCR Register

Offset: 0xed0c

Bits	Name	Description	Type	Reset
31:16	VECTKEY	Register key: Reads as Unknown On writes, write 0x05FA to VECTKEY, otherwise the write is ignored.	RW	0x0000
15	ENDIANESS	Data endianness implemented: 0 = Little-endian.	RO	0x0
14:3	Reserved.	-	-	-

Bits	Name	Description	Type	Reset
2	SYSRESETREQ	Writing 1 to this bit causes the SYSRESETREQ signal to the outer system to be asserted to request a reset. The intention is to force a large system reset of all major components except for debug. The C_HALT bit in the DCSR is cleared as a result of the system reset requested. The debugger does not lose contact with the device.	RW	0x0
1	VECTCLRACTIVE	Clears all active state information for fixed and configurable exceptions. This bit is self-clearing, can only be set by the DAP when the core is halted. When set: clears all active exception status of the processor, forces a return to Thread mode, forces an IPSR of 0. A debugger must re-initialize the stack.	RW	0x0
0	Reserved.	-	-	-

# Read and Write

they do stuff

- Read
  - reads the value of a register
  - might ask the peripheral to do something
- Write
  - writes the value to a register
  - might ask the peripheral to do something
    - SYSRESETREQ

    - Subsection 2.3.1 - *SIO*
      - Subsection 2.3.1.2 - *GPIO Control*
  - Section 2.4 - *Cortex-M0+* (except NVIC and MPU)
  - Section 2.19 - *GPIO* (except Interrupts)

# RP2040 GPIO Pins

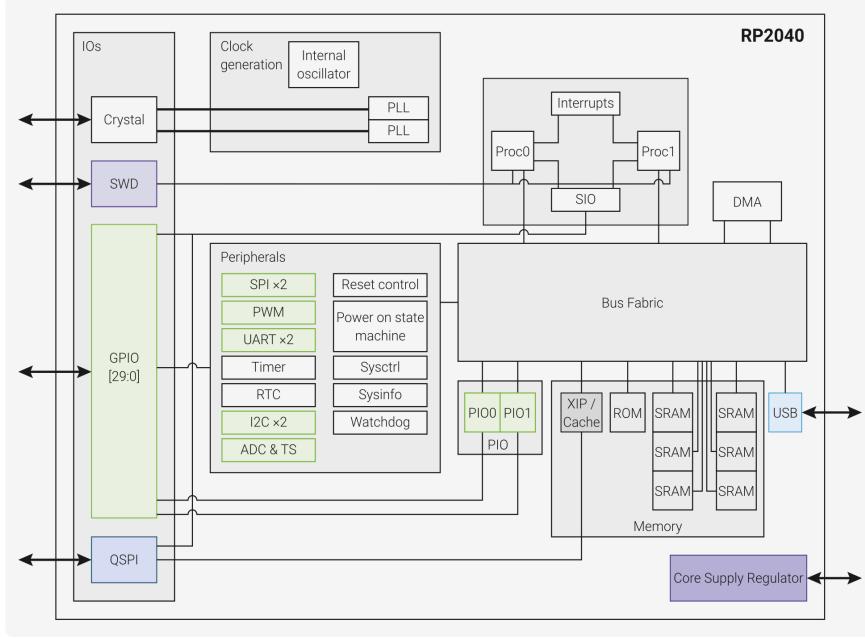

GPIO pins are connected to the processor pins through three peripherals

# GPIO

# Peripherals

*SIO:* Set the pin as Input or Output

*IO Bank (GPIO):* Use the correct MUX function (F5)

*PAD:* Set the pin input and output parameters

**SIO** Single Cycle Input/Output, is able to control the GPIO pins

**GPIO** Multiplexes the functions of the GPIO pins

# SIO Registers

The SIO registers start at a base address of `0xd0000000` (defined as `SIO_BASE` in SDK).

Offset	Name	Info
0x000	<a href="#">CPUID</a>	Processor core identifier
0x004	<a href="#">GPIO_IN</a>	Input value for GPIO pins

## ■ Input

- set `GPIO_OE` bit x to 0
- read `GPIO_IN` bit x

## ■ Output

- set `GPIO_OE` bit x to 1
- write `GPIO_OUT` bit x

## GPIO\_OE

Bits	Description	Type	Reset
31:30	Reserved.	-	-
29:0	Set output enable (1/0 → output/input) for GPIO0...29. Reading back gives the last value written. If core 0 and core 1 both write to <code>GPIO_OE</code> simultaneously (or to a SET/CLR/XOR alias), the result is as though the write from core 0 took place first, and the write from core 1 was then applied to that intermediate result.	RW	0x00000000

## GPIO\_IN

Bits	Description	Type	Reset
31:30	Reserved.	-	-
29:0	Input value for GPIO0...29	RO	0x00000000

## GPIO\_OUT

Bits	Description	Type	Reset
31:30	Reserved.	-	-
29:0	Set output level (1/0 → high/low) for GPIO0...29. Reading back gives the last value written, NOT the input value from the pins. If core 0 and core 1 both write to <code>GPIO_OUT</code> simultaneously (or to a SET/CLR/XOR alias), the result is as though the write from core 0 took place first, and the write from core 1 was then applied to that intermediate result.	RW	0x00000000

# SIO Input

# Input

read the value from pin `x`

- set the `FUNCSEL` field of `GPIOx_CTRL` to `5`
- set the `GPIO_OE_CLR` bit `x` to `1`
- read the `GPIO_IN` bit `x`
- *adjust the `GPIOx` fields to set the pull up/down resistor*

# Output

write a value to pin `x`

- set the `FUNCSEL` field of `GPIOx_CTRL` to `5`
- set the `GPIO_OE_SET` bit `x` to `1`
- if the value
  - is `0`, set the `GPIO_OUT_CLR` bit `x` to `1`
  - is `1`, set the `GPIO_OUT_SET` bit `x` to `1`
- *adjust the `GPIOx` fields to set the output current*

rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **MODEy[1:0]: Port x configuration I/O pin y (y = 15 to 0)**

These bits are written by software to configure the I/O mode.

00: Input mode

01: General purpose output mode

10: Alternate function mode

11: Analog mode (reset state)

## GPIOx\_ODR

Res.															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OD15	OD14	OD13	OD12	OD11	OD10	OD9	OD8	OD7	OD6	OD5	OD4	OD3	OD2	OD1	OD0
rw															

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **ODy: Port output data I/O pin y (y = 15 to 0)**

These bits can be read and written by software.

## GPIOx\_IDR

Res.															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ID15	ID14	ID13	ID12	ID11	ID10	ID9	ID8	ID7	ID6	ID5	ID4	ID3	ID2	ID1	ID0
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **IDy: Port x input data I/O pin y (y = 15 to 0)**

These bits are read-only. They contain the input value of the corresponding I/O port.

# GPIO Port enable

## RCC AHB2 peripheral clock enable register 1

### 11.8.30 RCC AHB2 peripheral clock enable register 1 (RCC\_AHB2ENR1)

Address offset: 0x08C

Reset value: 0x4000 0000 (for STM32U535/545)

Reset value: 0xC000 0000 (for STM32U575/585/59x/5Ax/5Fx/5Gx)

Access: no wait state, word, half-word, and byte access

**Note:** When the peripheral clock is not active, read or write access to peripheral registers is not supported.

24     let value = read_volatile(GPIOC_IDR);
25     let pin_val = (value & (1 << pin)) != 0;
26 }
```

# Input

read the value from pin `x` of port `y`

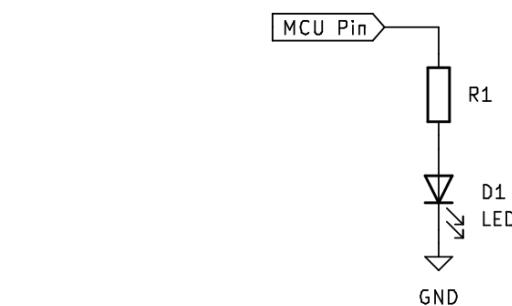

- enable the Port clock signal
- configure the pin as input by setting the pin's bits of the respective port's Mode Register, `GPIOy_MODER`, to `0b10`.
- read the `x` bit of the `GPIOy_IDR` register.
- *adjust the `GPIOy_PUPDR` fields to set the pull up/down resistor*

# Output

write a value to pin `x` of port `y`

- enable the Port clock signal
- configure the pin as output by setting the pin's bits of the respective port's Mode Register, `GPIOy_MODER`, to `0b10`.
- set the `x` bit of the `GPIOy_ODR` register.
- *adjust the Port `y` registers to set the speed and configuration*

# Rust Embedded HAL

The Rust API for embedded systems

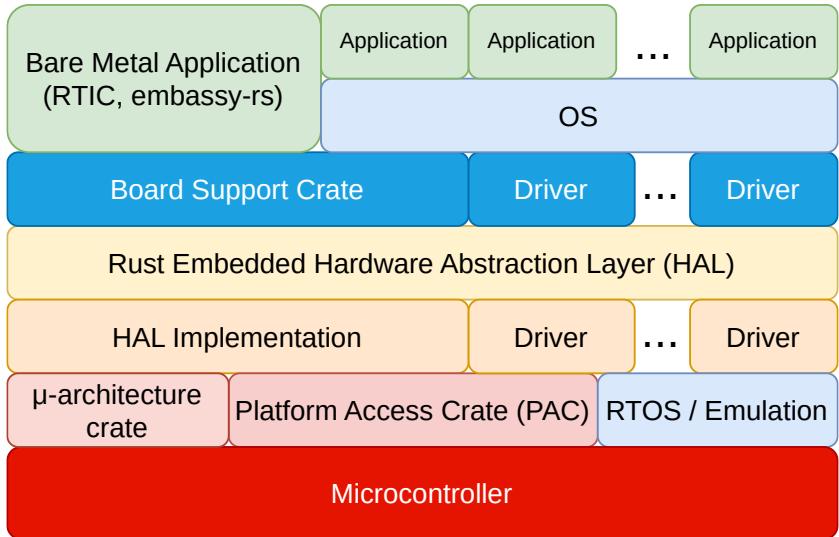

# The Rust Embedded Stack

Framework Tasks, Memory Management,  
Network etc. `embassy-  
rs`, `rtic`

BSC Board Support Crate `embassy-  
rp`, `rp-pico`, `embassy-  
stm32`

*HAL  
Implementation* Uses the PAC and exports a  
standard HAL towards the upper  
levels `embassy-stm32`

PAC Accesses registers, usually  
created automatically from SVD

# GPIO HAL

A set of standard traits

All devices should implement these traits for GPIO.

```
1  pub enum PinState {  
2      Low,  
3      High,  
4  }
```

## Input

```
pub trait InputPin: ErrorType {  
    // Required methods  
    fn is_high(&mut self) -> Result<bool, Self::Error>;  
    fn is_low(&mut self) -> Result<bool, Self::Error>;  
}
```

## Output

```
pub trait OutputPin: ErrorType {  
    // Required methods  
    fn set_low(&mut self) -> Result<(), Self::Error>;  
    fn set_high(&mut self) -> Result<(), Self::Error>;  
  
    // Provided method  
    fn set_state(  
        &mut self,  
        state: PinState  
    ) -> Result<(), Self::Error> { ... }  
}
```

# Bare metal

This is how a Rust application would look like

```
1  #![no_std]
2  #![no_main]
3
4  use cortex_m_rt::entry;
5  use core::panic::PanicInfo;
6
7  #[entry]
8  fn main() -> ! {
9      // your code goes here
10
11     loop {}
12 }
13
14 #[panic_handler]
15 pub fn panic(_info: &PanicInfo) -> ! {
16     loop {}
17 }
```

## Rules

1. never exit the `main` function
2. add a panic handler that does not exit

# Bare metal without PAC & HAL

This is how a Rust application would look like on the RP2

```
1  #![no_std]
2  #![no_main]
3
4  use core::ptr::{read_volatile, write_volatile};
5  use cortex_m_rt::entry;
6  use core::panic::PanicInfo;
7
8  const PIN: u32 = ...; // 0 to 20
9
10 const GPIOX_CTRL: u32 = 0x4001_4004;
11 const GPIO_OE_SET: *mut u32 = 0xd000_0024 as *mut u32;
12 const GPIO_OUT_SET: *mut u32 = 0xd000_0014 as *mut u32;
13 const GPIO_OUT_CLR: *mut u32 = 0xd000_0018 as *mut u32;
14
15 #[panic_handler]
16 pub fn panic(_info: &PanicInfo) -> ! {
17   loop {}
18 }
```

```
18  #[entry]
19  fn main() -> ! {
20    let gpio_ctrl = (GPIOX_CTRL + 8 * PIN) as *mut u32;
21    unsafe {
22      write_volatile(gpio_ctrl, 5);
23      write_volatile(GPIO_OE_SET, 1 << PIN);
24      let reg = match value {
25        0 => GPIO_OUT_CLR,
26        _ => GPIO_OUT_SET
27      };
28      write_volatile(reg, 1 << PIN);
29    };
30
31    loop {}
32 }
```

# Bare metal without PAC & HAL

This is how a Rust application would look like on the STM32U545RE

```
1  #![no_std]
2  #![no_main]
3
4  use core::ptr::{read_volatile, write_volatile};
5  use cortex_m_rt::entry;
6  use core::panic::PanicInfo;
7
8  const PORT_X: u32 = ...; // A is 0, B is 1, ...
9  const PIN: u32 = ...; // Ranging from 0 to 15
10
11 const GPIOx_BASE_ADDR: usize =
12     0x4202_0000 + 0x400 * PORT_X;
13 const GPIOx_MODER: *mut u32 =
14     GPIOx_BASE_ADDR as *mut u32;
15 const GPIOx_ODR: *mut u32 =
